

Entecavir

Brand Name: Baraclude

Drug Class: Opportunistic Infection and Other Drugs

Entecavir, also known as Baraclude, belongs to the class of medicines called antivirals. Antivirals kill viruses or stop viruses from multiplying. When infections occur in patients with weakened immune systems, including people with HIV or AIDS, they tend to be more serious and are called opportunistic infections (OIs).

HIV/AIDS-Related Uses

Entecavir was approved by the FDA on March 30, 2005, for the treatment of chronic hepatitis B virus infection, a common coinfection in people with HIV. This medicine does not cure or prevent HIV infection or AIDS and does not reduce the risk of passing the virus to other people.

Dosage Form/Administration

Entecavir comes in tablet and oral suspension forms and is taken by mouth without food. Entecavir should be taken 2 hours after a meal and 2 hours before the next meal.

Contraindications

Individuals should tell a doctor about any medical problems before taking this medicine. Patients with decreased creatinine clearance may require dosage adjustment when taking entecavir.

Possible Side Effects

Along with its desired effects, entecavir can cause some unwanted effects. Although not all of entecavir's side effects are known, headache, unusual tiredness or weakness, dizziness, and nausea have been reported.

Drug and Food Interactions

A doctor should be notified of any other medications being taken, including prescription, nonprescription (over-the-counter), or herbal medications.

Clinical Trials

For information on clinical trials that involve Entecavir, visit the ClinicalTrials.gov web site at <http://www.clinicaltrials.gov>. In the Search box, enter: Entecavir AND HIV Infections.
